Undirected graphs

**Graph: Set of vertices connected pairwise by edges.**

Title III Wiretap Orders 1968-2011

# Undirected graphs

Graph: Set of vertices connected pairwise by edges.

Undirected graphs

Graph: Set of vertices connected pairwise by edges.

Prof. Youngsup Kim, idebtor@gmail.com, Data Structures, CSEE Dept., Handong Global University

4

Undirected graphs

Graph: Set of vertices connected pairwise by edges.

- *Why study graph algorithms?*

Prof. Youngsup Kim, idebtor@gmail.com, Data Structures, CSEE Dept., Handong Global University

5
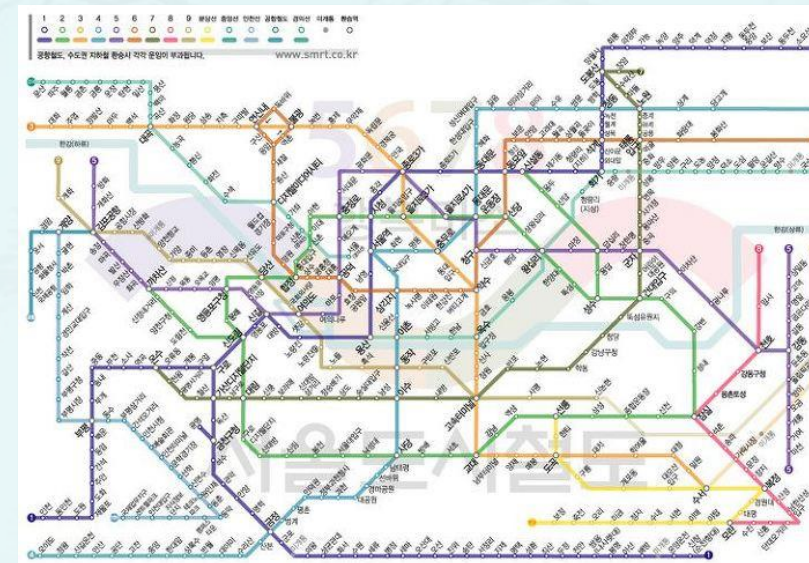

Undirected graphs

## Graph: Set of vertices connected pairwise by edges.

- *Why study graph algorithms?*
  - Thousands of practical applications.
  - Hundreds of graph algorithms known.
  - Interesting and broadly useful abstraction.
  - Challenging branch of computer science and discrete math.

Prof. Youngsup Kim, idebtor@gmail.com, Data Structures, CSEE Dept., Handong Global University

The Spread of Obesity in a Large Social
Network over 32 Years

Figure 1. Largest Connected Subcomponent of the Social Network in the Framingham Heart Study in the Year 2000.
Each circle (node) represents one person in the data set. There are 2200 persons in this subcomponent of the social network. Circles with red borders denote women, and circles with blue borders denote men. The size of each circle is proportional to the person's body-mass index. The interior color of the circles indicates the person's obesity status: yellow denotes an obese person (body-mass index, ≥30) and green denotes a nonobese person. The colors of the ties between the nodes indicate the relationship between them: purple denotes a friendship or marital tie and orange denotes a familial tie.

Graph Applications

graph	vertex	edge
communication	telephone, computer	fiber optic cable
circuit	gate, register, processor	wire
mechanical	joint	rod, beam, spring
financial	stock, currency	transactions
transportation	street intersection, airport	highway, airway route
internet	class C network	connection
social relationship	person, actor	friendship, movie cast
neural network	neuron	synapse
protein network	protein	protein-protein interaction
molecule	atom	bond

Graph Terminology

Path: Sequence of vertices connected by edges.
Cycle: Path whose first and last vertices are the same.

Graph Terminology

Path: Sequence of vertices connected by edges.
Cycle: Path whose first and last vertices are the same.

Two vertices are connected if there is a path between them.

Graph Terminology

Path: Sequence of vertices connected by edges.
Cycle: Path whose first and last vertices are the same.

Two vertices are connected if there is a path between them.
Some graph-processing problems

Path   Is there a path between *s* and *t* ?

Shortest Path   What is the shortest path between *s* and *t* ?

Some graph-processing problems

Path   Is there a path between *s* and *t* ?

Shortest Path What is the shortest path between *s* and *t* ?

Cycle   Is there a cycle in the graph?

Euler tour   Is there a cycle that uses each edge exactly once?

Hamilton tour Is there a cycle that uses each vertex exactly once.

Some graph-processing problems

Path   Is there a path between *s* and *t* ?
Shortest Path What is the shortest path between *s* and *t* ?

Cycle   Is there a cycle in the graph?
Euler tour   Is there a cycle that uses each edge exactly once?
Hamilton tour Is there a cycle that uses each vertex exactly once.

Connectivity Is there a way to connect all of the vertices?
MST   What is the best way to connect all of the vertices?
BiConnectivity Is there a vertex whose removal disconnects the graph?

Some graph-processing problems

Graph drawing. Provides intuition about the structure of the graph.
two drawings of the same graph

Graph Representation

Vertex representation.
- We use integers between **0** and **V − 1**.
- Applications: convert between names and integers with symbol table.
Anomalies.
Graph ADT in Java

public class	Graph	
	Graph(int V)	*create an empty graph with V vertices*
	Graph(char *fname)	*create a graph from input stream*
void	addEdge(int v, int w)	*add an edge v-w*
Iterable<Integer>	adj(int V)	*vertices adjacent to v*
int	V()	*number of vertices*
int	E()	*number of edges*
	toString()	*string representation*

29

Graph Coding

Compute the degree of V

```c
int degree(graph g, int v) {
  if (!validVertex(g, v)) return -1;
  int deg = 0;
  for (gnode w = g->adj[v].next; w; w = w->next, deg++);
  return deg;
}
```

Compute maximum degree

```c
int degree(graph g) {
  int max = 0;
  for (int v = 0; v < V(g); ++v) {
    int deg = degree(g, v);
    if (deg > max) max = deg;
  }
  return max;
}
```

Compute average degree

```c
double degree_average(graph g) {
  int return 2.0 * E(g) / V(g);
}
```

1. **Edge list**
2. **Adjacency matrix**
3. **Adjacency list**

31

Prof. Youngsup Kim, idebtor@gmail.com, Data Structures, CSEE Dept., Handong Global University

Graph Coding – edge list

1. **Maintain a list of the edges (linked list or array)**
Edge list

```
0  1
0  2
0  5
0  6
3  4
3  5
4  5
4  6
7  8
9  10
9  11
9  12
11  12
```

Prof. Youngsup Kim, idebtor@gmail.com, Data Structures, CSEE Dept., Handong Global University

32
Graph Coding – Adjacency-matrix 인접행렬

2. Maintain a two-dimensional V-by-V Boolean array;
   for each edge v-w in graph: adj[v][w] = adj[w][v] = true.

two entries for each edge

Why two entries?

	0	1	2	3	4	5	6	7	8	9	10	11	12
0	0	1	1	0	0	1	1	0	0	0	0	0	0
1	1	0	0	0	0	0	0	0	0	0	0	0	0
2	1	0	0	0	0	0	0	0	0	0	0	0	0
3	0	0	0	0	1	1	0	0	0	0	0	0	0

12	0	0	0	0	0	0	0	0	0	1	0	1	0

Graph Coding – Adjacency list 인접리스트

3. Maintain vertex-index array of lists.

use Bag in Java.
use a linked list in C.

Prof. Youngsup Kim, idebtor@gmail.com, Data Structures, CSEE Dept., Handong Global University

35
Graph Coding – graph.h

```
// a structure to represent an adjacency list node
struct Gnode {
  int     item;
  Gnode* next;                  adjacency list nodes (using a linked list)
  Gnode (int i = 0, Gnode *p = nullptr) {
    item = i;  next = p;
  }
  ~Gnode() {}
};

using gnode = Gnode *;
```

```cpp
struct Graph {
  int V;                 // number of vertices in the graph
  int E;                 // number of edges in the graph
  gnode adj;             // an array of adjacency lists (or gnode pointers)

  Graph(int v = 0) { // constructs a graph with v vertices
    V = v;
    E = 0;

    // initialize each adjacency list as an empty list;
    for (int  i = 0; i < V; i++) {

    }
  }
  ~Graph() {}
};
using graph = Graph *;
```

set each adj list nullptr

unused; but may store the size of degree.

```cpp
struct Graph {
  int V;                  // number of vertices in the graph
  int E;                  // number of edges in the graph
  gnode adj;              // an array of adjacency lists (or gnode pointers)

  Graph(int v = 0) { // constructs a graph with v vertices
    V = v;
    E = 0;

    // initialize each adjacency list as an empty list;
    for (int  i = 0; i < V; i++) {
      g->adj[i].next = nullptr;        ← set each adj list nullptr
      g->adj[i].item = i;
    }                                  unused; but may store the size of degree.
  }
  ~Graph() {}
};
using graph = Graph *;
```

38

Prof. Youngsup Kim, idebtor@gmail.com, Data Structures, CSEE Dept., Handong Global University

```
// add an edge to an undirected graph

void addEdgeFromTo(graph g, int v, int w) {
    // add an edge from v to w.
    // A new vertex is added to the adjacency list of v.
    // The vertex is added at the beginning

    gnode node = new Gnode(w);
    g->adj[v].next = node;
    g->E++;
}

// add an edge to an undirected graph
void addEdge(graph g, int v, int w) {
    addEdgeFromTo(g, v, w); // add an edge from v to w.
    addEdgeFromTo(g, w, v); // if graph is undirected, add both
}
```

instantiate a node w insert it
at **the front of** adjacency list[v]

add an edge for undirected graph

In practice: Use adjacency-lists representation.
- Algorithms based on iterating over vertices adjacent to v.
- Real-world graphs tend to be sparse.

huge number of vertices,
small average vertex degree

In practice: Use adjacency-lists representation.
- Algorithms based on iterating over vertices adjacent to v.
- Real-world graphs tend to be sparse.

huge number of vertices,
small average vertex degree

sparse (E = 200)   dense (E = 1000)

Two graphs (V = 50)

Prof. Youngsup Kim, idebtor@gmail.com, Data Structures, CSEE Dept., Handong Global University

42

Graph Coding – Adjacency-matrix 인접행렬

In practice: Use adjacency-lists representation.
- Algorithms based on iterating over vertices adjacent to v.
- Real-world graphs tend to be sparse.

huge number of vertices,
small average vertex degree

representation	space	add edge	edge between v and w?	iterate over vertices adjacent to v?
list of edges	E	1	E	E
adjacency matrix	V^2	1		
adjacency lists	$E + V$	1		

Graph Coding – Adjacency-matrix 인접행렬

In practice: Use adjacency-lists representation.
